

PROBLEM: THERE'S A LOT MORE TO DESIGN THAN JUST MODELING!

"It's not enough to have a correct 3d SolidWorks model. I need correct drawings, a BOM and reports to get my designs quoted and out to manufacturing."

SOLUTION: POWER2

It doesn't help to speed up one part of the design process, if the other parts are still slowing you down. Power2 allows you to take control your design process in by automating it to produce coordinated design documentation, ready for your customers and ready for manufacturing.

Your Power2 built application integrates tightly with SolidWorks to:

- **Handle engineering calculations**
- **Look-up required data from databases and tables**
- **Build a valid 3d SolidWorks model**
- **Generate drawings**
- **Write out a BOM**
- **Write out quotes, sales and engineering reports**

Now, a single person can handle tasks that required contributions from several people in sales and engineering, while both speeding up the process and producing a correct and consistent set of design documents.

Engineering is hard, but using Power2 is easy. Your engineers capture their design rules as diagrams to automate your design problems. Then, anyone who understands your product can enter a specification and generate correct designs.

Kick start your entire design process. Generate drawings, BOMs and reports with Power2.

Power2. The Power2 do more with less.
